DAY 17 — AI FOR DECISION MAKING

Marketing, Customer, HR & Talent Decisions | Crisis Management | Responsible AI

Learning outcome:

- Create a report
- Dashboard outline
- Executive summary using
- AI-supported analysis and responsible judgment.

Hour 1: AI for marketing & customer decisions

Theory:

- Marketing decisions aim to reach the right audience with the right offer and message.
- Customer decisions use information about needs, behavior, feedback, and value.
- AI can help summarize reviews, group customers, draft campaign ideas, and compare results.

Customer journey:

- Awareness: people first learn about the service
- Consideration: they compare options
- Purchase: they enroll or buy
- Retention: they return or continue
- Advocacy: they recommend to others

AI should support insight; it should not guess customer facts.

Key marketing measures:

- Reach: number of people who saw a message
- Leads: people who showed interest
- Conversion rate: customers / leads × 100
- Cost per lead: campaign cost / leads
- Retention: customers who continue or return

Segmentation:

Grouping customers by a useful shared trait, such as location, course interest, or previous purchase.

Example:

A center has students interested in “basic AI” and “digital marketing.” Separate messages may perform better than one general message.

Hour 1: Easy practice — select a campaign

Campaign data:

- Campaign A: cost 5,000 BDT; leads 100; enrollments 10
- Campaign B: cost 6,000 BDT; leads 80; enrollments 16

Tasks:

1. Calculate conversion rate for A and B.
2. Calculate cost per enrollment for A and B.
3. Choose one campaign for next month.
4. State one extra fact you would check before deciding.

Easy AI prompt:

“Compare Campaign A and Campaign B. Calculate conversion rate and cost per enrollment. Give a simple recommendation, list one limitation, and do not invent extra data.”

Hour 2: AI for HR & talent decisions

Theory:

- HR decisions include hiring, training, performance support, and retention.
- Talent decision making matches role requirements with evidence of skills and experience.
- AI can help organize job requirements, summarize CVs, create interview questions, and identify missing information.

Matching process:

1. Define the job requirements.
2. Use the same criteria for every candidate.
3. Review evidence, not assumptions.
4. Conduct human review and interviews.
5. Record the reason for the decision.

Fairness and bias:

- Bias is an unfair pattern that can affect a decision.
- Avoid using protected or irrelevant personal information.
- Use skills-based, job-related criteria.
- An AI ranking is not a final hiring decision.

Example job criteria:

- Basic Excel skill
- Customer communication
- Relevant experience
- Availability for the schedule

Good practice: remove names, photos, and unrelated personal details before comparison when possible.

Hour 2: Easy practice — candidate scorecard

Role: Training assistant

Criteria: Excel (0–2), communication (0–2), training experience (0–2)

Candidate X: Excel 2, communication 1, experience 1

Candidate Y: Excel 1, communication 2, experience 2

Candidate Z: Excel 2, communication 2, experience 0

Tasks:

1. Add each score.
2. Select two candidates for interview.
3. Write one fair interview question for all candidates.

Easy AI prompt:

“Create a fair interview scorecard for a training assistant using Excel skill, communication, and training experience. Do not use age, gender, name, photo, or other irrelevant personal details.”

Hour 3: Analyze real-world data for decisions

Theory:

- A business decision should begin with a clear question, not with a tool.
- Data helps answer “what happened?” and may suggest “what to investigate next?”
- Analysis should separate facts, interpretations, and recommendations.

Simple analysis workflow:

1. Define the question
2. Check the time period and data source
3. Calculate or compare key measures
4. Identify a pattern or gap
5. State uncertainty
6. Recommend a next action

Correlation is not proof of cause. Two changes can occur together for different reasons.

Data-quality questions:

- Is any value missing?
- Are the categories consistent?
- Is the time period comparable?
- Is the sample large enough?
- What information is not included?

Example:

Sales increased after a social-media post. This does not prove that the post caused the increase; other factors could have contributed.

AI role:

Ask AI to identify trends, calculation steps, alternative explanations, and questions to investigate. Verify every number against the original table.

Hour 3: Easy practice — small business case

Case data:

- January: 60 leads, 12 enrollments, 48,000 BDT revenue
- February: 80 leads, 12 enrollments, 48,000 BDT revenue
- March: 100 leads, 15 enrollments, 60,000 BDT revenue

Tasks:

1. Which month had the most leads?
2. Which month had the most enrollments?
3. What happened to conversion from January to March?
4. Write one action to test next month.

Expected observations:

- March had the most leads and enrollments.
- January conversion = 20%; March conversion = 15%.
- More leads did not produce a higher conversion rate.
- Action: improve follow-up messages or check lead quality.

Easy AI prompt:

“Analyze this three-month table. Give three facts, one concern, and one action to test next month. Show conversion-rate formulas and do not claim causes without evidence.”

Hour 4: Reports, dashboards & executive summaries

Theory:

- A report explains detailed information; a dashboard shows key measures quickly; an executive summary presents the main decision message.
- The audience determines the detail: an executive needs a concise decision-focused summary.

Executive-summary structure:

1. Situation: what is happening?
2. Key evidence: what do the numbers show?
3. Recommendation: what should happen next?
4. Risk: what could change the result?
5. Action: who will do what and when?

Use plain language and avoid unsupported certainty.

Dashboard theory:

- A KPI must have a clear definition and time period.
- Compare actual versus target, previous period, or benchmark.
- A good dashboard highlights a decision or action, not just numbers.

Example KPIs for a training center:

- Leads, enrollments, conversion rate
- Attendance rate, completion rate
- Revenue, cost per enrollment
- Learner satisfaction

Quality test: Could a manager explain the next action after viewing the report?

Hour 4: Easy practice — executive summary

Use this information:

- March leads: 100
- March enrollments: 15
- March conversion rate: 15%
- January conversion rate: 20%
- March revenue: 60,000 BDT

Write a four-line executive summary:

- Situation: _____
- Evidence: _____
- Recommendation: _____
- Next action: _____

Example response:

- Situation: Leads and revenue increased, but conversion declined.
- Evidence: Conversion fell from 20% in January to 15% in March.
- Recommendation: Improve lead follow-up before increasing advertising spend.
- Next action: Marketing officer tests two follow-up messages this week.

Easy AI prompt:

“Write a four-line executive summary from these figures. Keep the language simple. Separate facts from recommendation and include one next action.”

Hour 5: Crisis management & risk mitigation

Theory:

- A crisis is a serious event that needs a fast, coordinated response.
- Risk mitigation means reducing the chance or impact of a problem before or during an event.
- AI can help draft communication, summarize updates, list response steps, and organize a risk register.

Crisis-response cycle:

1. Detect and verify the issue
2. Assess impact and urgency
3. Assign a response owner
4. Communicate accurate information
5. Take corrective action
6. Review and improve after the event

Risk register fields:

- Risk or incident
- Likelihood
- Impact
- Owner
- Immediate response
- Mitigation
- Communication audience

Communication principles:

- Be accurate, timely, and calm.
- Do not hide known facts or invent updates.
- State what is known, what is being checked, and the next update time.

AI caution: review crisis messages before sending; incorrect wording can create further harm.

Hour 5: Easy practice — simple crisis plan

Scenario:

“The online class platform stops working 15 minutes before a live session.”

Complete this table in notes:

- Immediate action: _____
- Response owner: _____
- Message to learners: _____
- Backup plan: _____
- Prevention for next class: _____

Keep the learner message under 30 words.

Example answer:

- Immediate action: confirm the outage and notify learners.
- Owner: course coordinator.
- Learner message: “We are experiencing a platform issue. Please wait for an updated link within 15 minutes.”
- Backup plan: use an alternative meeting link or reschedule.
- Prevention: test the platform and backup link before class.

Easy AI prompt:

“Create a calm, clear learner message for an online-class platform outage. Use fewer than 30 words. Do not promise a time unless it is known.”

Hour 6: Responsible AI — core principles

Theory:

• Responsible AI means using AI in ways that are safe, fair, lawful, transparent, and accountable.

• High-impact decisions—such as hiring, customer eligibility, or emergency communications—need stronger human review.

Core principles:

• Fairness: avoid unjust discrimination

• Privacy: protect personal and confidential data

• Transparency: explain when and how AI contributed

• Accountability: a person or organization remains responsible

• Safety: test for harmful or incorrect output

• Human oversight: people can review, correct, or stop an AI-supported process

Practical rules:

• Do not share confidential information without permission.

• Check factual claims, calculations, sources, and dates.

• Ask for uncertainty and alternative interpretations.

• Document important prompts, data sources, and decisions.

• Escalate sensitive cases to a responsible human decision-maker.

Example:

If AI recommends a candidate list, a human reviewer checks the job criteria, evidence, fairness, and final interview selection.

Key message: AI can assist; accountability remains human.

Hour 6: Easy practice — responsible AI checklist

Before using AI output, answer Yes or No:

1. Did I remove unnecessary personal or confidential data?
2. Did I provide a clear task and decision criteria?
3. Did I check the output against the source information?
4. Did I identify assumptions or missing information?
5. Did I consider fairness and possible harm?
6. Is a human responsible for the final action?

If any answer is “No,” pause and improve the process.

Final practice prompt:

“Review this AI-assisted recommendation using a responsible-AI checklist. Identify privacy, fairness, accuracy, and accountability risks. Suggest simple improvements. Do not make the final decision for me.”

Exit ticket:

- One thing AI can help me do: _____
- One fact I will always verify: _____
- One situation requiring human review: _____

Course alignment: Day 17 topics from the supplied module—marketing/customer decisions, HR/talent decisions, real-world business analysis, evaluation, crisis management/risk mitigation, and responsible AI.
