DAY 21 — AI FOR MARKETING & CONTENT CREATION

Data-Driven Decisions, AI Opportunities, AI Infrastructure, Customer Insights & Automation

Learning outcome:

1. Master data-driven marketing decisions,
2. Identify high-impact AI business opportunities,
3. Structure AI-ready infrastructure,
4. Synthesize customer insights
5. Automate core sales & marketing workflows.

Hour 1: Data-driven marketing decisions

Theory:

• Data-driven marketing relies on empirical evidence from analytics rather than subjective intuition or guesswork.

• **Core marketing decision frameworks:**

- Multi-touch attribution: understanding which touchpoints (first click, last click, linear) drive sales.

- Statistical significance in A/B testing: ensuring sample sizes and confidence levels (e.g. 95%) prevent false winners.

- Customer acquisition economics: balancing Customer Acquisition Cost (CAC) against Customer Lifetime Value (LTV).

• Ratio rule of thumb: Healthy businesses maintain LTV : CAC >= 3 : 1.

Marketing KPIs for decisions:

• CPA (Cost Per Acquisition): Total Campaign Spend / New Paying Customers.

• Conversion Rate (CVR): (Conversions / Total Visitors) × 100.

• ROAS (Return on Ad Spend): Total Attributed Revenue / Ad Spend.

Example decision dilemma:

Campaign A has higher clicks but 1.2% conversion. Campaign B has fewer clicks but 4.5% conversion and lower CPA. Data-driven decision: allocate budget to Campaign B.

Role of AI tools:

Use ChatGPT/Gemini/Copilot to calculate conversion rates, forecast budget outcomes, and identify anomalies across channels.

Hour 1: Easy practice — ad campaign optimization

Campaign performance dataset:

- Campaign Alpha: Ad Spend $1,000 | Impressions 50,000 | Clicks 1,500 | Sales 30 | Revenue $3,000
- Campaign Beta: Ad Spend $1,000 | Impressions 80,000 | Clicks 1,000 | Sales 50 | Revenue $5,000

Tasks:

1. Calculate Conversion Rate (Sales/Clicks) for both.
2. Calculate Cost Per Acquisition (CPA) for both.
3. Calculate ROAS for both.
4. Decide which campaign to scale with an extra $2,000 budget.

Easy AI prompt (ChatGPT/Copilot):

“Analyze these two ad campaigns: Alpha ($1k spend, 1.5k clicks, 30 sales, $3k rev) and Beta ($1k spend, 1k clicks, 50 sales, $5k rev). Calculate CVR, CPA, and ROAS. Provide an executive reallocation recommendation in 2 sentences.”

Hour 2: Identifying AI opportunities in business

Theory:

• Successful AI adoption begins by identifying high-value, repetitive, and bottleneck business processes.

• **Opportunity Evaluation Matrix (Impact vs. Feasibility):**

- Quick Wins (High Impact, High Feasibility): customer FAQ chatbots, automated email drafts, social copy generation.

- Strategic Projects (High Impact, Lower Feasibility): custom predictive churn modeling, deep ERP AI integrations.

- Low Priority (Low Impact, High Feasibility): minor formatting tasks.

- Avoid (Low Impact, Low Feasibility): complex custom models for rare tasks.

Task audit methodology:

1. Frequency: Is this task done daily or hourly?
2. Standardization: Does it follow structured rules and guidelines?
3. Human error rate: Do manual fatigue errors cost money?
4. Scalability: If volume triples, will staff need to triple without AI?

ROI calculation formula for AI adoption:

Annual Net Benefit = (Hours Saved × Hourly Rate) + Incremental Revenue − AI Tool & Training Cost.

Key principle: automate repetitive cognitive tasks so staff can focus on high-value human relationships.

Hour 2: Easy practice — AI opportunity scoring

Company marketing tasks to evaluate:

1. Writing weekly product update newsletters (4 hrs/wk).
2. Answering 200 identical refund policy emails/day (15 hrs/wk).
3. Negotiating annual enterprise partner contracts (3 hrs/mo).
4. Categorizing inbound customer review sentiment (6 hrs/wk).

Tasks:

1. Score each task as High, Medium, or Low for AI automation.
2. Select the #1 "Quick Win" and explain why.

Easy AI prompt (Claude/ChatGPT):

“Act as an AI strategy consultant. Evaluate these 4 business tasks for AI automation suitability: newsletter drafting, refund email replies, contract negotiations, and review tagging. Rank them by ROI feasibility.”

Hour 3: Building AI-ready infrastructure

Theory: AI infrastructure pillars

• An organization cannot scale AI without structured data, clear guidelines, and accessible tooling.

• **The 4 pillars of AI readiness:**

1. Data Centralization: aggregating siloed data (CRM, email, spreadsheets) into clean repositories.

2. Tool Standardization: defining approved enterprise tools (ChatGPT Enterprise, Copilot 365, NotebookLM).

3. Prompt Repositories: sharing tested system prompts, brand voice guidelines, and templates across teams.

4. Security & Access Control: role-based permissions preventing unauthorized PII access.

Data hygiene for AI ingestion:

• Clean formats: CSV, JSON, Markdown, structured Docs.

• Versioning: maintaining up-to-date documentation and catalogs.

• Context windows: structuring reference documents so LLMs do not exceed token limits or lose key facts.

Brand Voice Guidelines template:

• Mission & Tone adjectives (e.g. "Authoritative, helpful, concise").

• Banned words & industry jargon to avoid.

• Target customer persona definitions.

• Approved product positioning statements.

Hour 3: Easy practice — marketing AI setup template

Infrastructure setup exercise:

“Your agency wants all 5 team members to generate consistent social media posts for a B2B SaaS client without sounding generic.”

Tasks:

1. Draft a 3-part System Prompt Specification (Role, Brand Tone Rules, Negative Constraints).
2. Define 2 security rules for team members entering client data.

Easy AI prompt (Copilot/Gemini):

“Create a reusable master prompt template for a B2B SaaS marketing team that enforces tone of voice, output format, and strict data privacy constraints.”

Hour 4: Customer insights with AI & NotebookLM

Theory: customer insight synthesis

• Qualitative customer insights (interview transcripts, support tickets, survey open-text) are often too voluminous for manual reading.

• **Grounded AI with Google NotebookLM:**

- Groundedness: restricts AI answers strictly to uploaded source notes (PDFs, Docs, transcripts) without outside hallucination.

- Source citations: clicks directly to exact passages in uploaded transcripts.

- Audio Overviews: generates interactive podcast-style summaries of complex research.

• Synthesizing customer personas: extracting exact motivations, fears, purchasing triggers, and objections.

Customer insight extraction framework:

• Pain Point: What specific problem frustrates the user today?

• Desire: What ideal outcome are they trying to achieve?

• Objection: Why might they hesitate to purchase?

• Trigger: What event forces them to look for a solution now?

Research AI tools:

• NotebookLM: document-grounded insight synthesis.

• Perplexity AI: real-time market trends and competitor audience analysis.

• Claude / ChatGPT: semantic categorization of customer sentiment.

Hour 4: Easy practice — transcript insight mining

Customer interview excerpt (3 quotes):

1. "I love the software features, but onboarding took 3 weeks and our team got confused by the interface."
2. "We switched from Competitor X because your pricing was transparent, but we miss their 24/7 phone support."
3. "If there were video tutorials for beginners, I would recommend this to all my peers."

Tasks:

1. Extract the top 2 customer friction points.
2. Extract 1 core product advantage.
3. Propose 1 marketing content asset to address objections.

Easy AI prompt (NotebookLLM/ChatGPT):

“From these customer interview quotes, extract: (1) Core Value Proposition, (2) Major Objections/Frictions, and (3) Recommended marketing content response. Ground answers strictly in the text.”

Hour 5: Automating business processes with AI

Theory: AI workflow automation

• Workflow automation connects trigger events (e.g. new form submission) with AI cognitive tasks (summarizing, scoring, replying) and actions (updating CRM, sending email).

• **No-Code / Low-Code AI automation stack:**

- Triggers: Typeform, Google Forms, Webhook, Gmail, Stripe payment.

- AI Actions: ChatGPT / Claude API (parsing text, sentiment check, draft response).

- Integrations: Google Sheets, HubSpot, Slack, Notion, ActiveCampaign.

• Tools: Zapier AI, Make.com, Microsoft Power Automate, n8n.

Key automated business workflows:

1. Instant Lead Triage: parse incoming lead inquiry → AI scores lead → alerts sales on Slack if score > 80.

2. Smart Auto-Responder: classify email intent (Billing, Sales, Technical) → generate custom draft for human review.

3. Social Listening & Alerting: monitor brand mentions → AI flags negative tweets for rapid crisis intervention.

Automation guardrail:

Always use Human-in-the-Loop for outgoing customer emails or high-value contracts until system accuracy reaches 99%+.

Hour 5: Easy practice — 4-step automation map

Workflow design exercise:

“Design an automated workflow for an online training institute when a prospective student fills out a ‘Contact Us’ form.”

Fill in the 4 steps:

- Step 1 (Trigger): _____
- Step 2 (AI Processing): _____
- Step 3 (Database Action): _____
- Step 4 (Communication Action): _____

Easy AI prompt (ChatGPT/Make AI):

“Outline a 4-step Zapier automation connecting Google Forms, ChatGPT API, and Gmail to handle incoming customer course inquiries automatically.”

Hour 6: AI in marketing & sales workflows

Theory: full-funnel sales enablement

• AI streamlines every stage of the modern B2B/B2C sales pipeline:

- Top of Funnel (Attract): SEO blog post outlines, social video scripts (Canva, InVideo).
- Middle of Funnel (Engage): customized case studies, dynamic email drip campaigns.
- Bottom of Funnel (Convert): personalized sales proposals, objection-handling cheat sheets.
- Post-Purchase (Retain): onboarding checklists, churn prevention alerts.

Hyper-personalization at scale:

Using AI to customize outreach messages based on prospect LinkedIn profiles, industry challenges, and company news.

Day 21 summary & key takeaways:

• Data-driven decisions (CPA, CVR, ROAS) ensure marketing budget is spent effectively.

• Identify AI opportunities using the Impact vs. Feasibility matrix.

• Build AI infrastructure with clean data, prompt libraries, and security.

• Leverage NotebookLM for grounded, hallucination-free customer research.

• Automate repetitive sales and marketing loops to scale business growth.

Exit ticket (5 minutes):

1. What metric proves Campaign Beta is better than Alpha?
2. Name one feature that makes NotebookLM ideal for customer research.
3. Name one automated workflow you will implement.

Hour 6: Easy practice — B2B sales sequence

Scenario: Outreach to HR managers for an employee "AI Basic Skills Training" course.

Tasks:

1. Use AI to draft a 2-step email sequence:

- Email 1 (Day 1): Value hook focusing on employee productivity gains.
- Email 2 (Day 4): Follow-up sharing a 1-page case study summary with a meeting CTA.

2. Keep each email under 75 words.

3. Review for professional, non-pushy tone.

Easy AI prompt (Claude/ChatGPT):

“Write a 2-step B2B sales email sequence to HR Directors offering corporate AI training. Keep each email under 75 words. Tone: consultative, polite, benefit-driven.”
