DAY 20 — AI FOR MARKETING & CONTENT CREATION

Phase 2: Basic AI for Work & Employment

Learning outcome:

- Master enterprise AI technologies
- Data collection & management,
- Business intelligence tools,
- Machine learning fundamentals for business.

Hour 1: Overview of AI technologies in business

Theory:

• AI in business transforms how companies create value, understand customers, and automate operations.

• **Core categories of business AI:**

- Generative AI: creates original text, marketing copy, graphics, code, and video.
- Predictive AI: forecasts customer churn, sales trends, demand, and risk.
- Conversational AI: customer support chatbots, sales agents, virtual assistants.
- Robotic Process Automation (RPA + AI): automates repetitive clerical tasks.

Business value drivers: cost reduction, speed-to-market, personalization at scale, and enhanced decision accuracy.

Enterprise adoption roadmap:

1. Identify bottleneck: where is manual effort slowing down business growth?
2. Select AI capability: text generation, data categorization, or forecasting.
3. Establish human review: ensure accuracy, brand tone, and compliance.
4. Measure ROI: calculate time saved and revenue impact.

Example:

An e-commerce store uses Generative AI to write 500 product descriptions in 2 hours instead of 2 weeks, reducing copywriting costs by 80%.

Key rule: AI augments business strategy; it does not replace core customer value.

Hour 1: Easy practice — business AI mapping

Scenario:

“A growing online fashion boutique is struggling with three bottlenecks: slow customer inquiry replies, generic email campaigns, and slow social media post creation.”

Tasks:

1. Match each bottleneck to the right AI technology category.
2. Name one concrete AI tool for each problem.
3. Identify one business risk for each solution.
4. Write one KPI to measure improvement.

Easy AI prompt:

“Act as a digital marketing consultant. For an online fashion boutique, propose three AI tools to solve slow customer response, low email engagement, and slow social media creation. Include one metric for each.”

Theory:

• Different AI platforms possess distinct strengths in enterprise workflows:

- ChatGPT (OpenAI): exceptional general reasoning, creative marketing copy, workflow automation.
- Google Gemini: real-time web multimodal search, Google Workspace integration, research.
- Claude (Anthropic): long-document analysis, nuanced professional writing, brand guidelines.
- Microsoft Copilot: seamless MS Office, Excel, and Teams enterprise integration.
- Perplexity AI: cited research, competitor market intelligence, factual sourcing.

Effective content creation framework:

• Role: define the specific marketing persona (e.g., "Senior B2B Copywriter").

• Context: target audience, product USP, and customer pain points.

• Task: format, length, and call-to-action (CTA).

• Tone & Constraints: brand voice guidelines (e.g., "friendly yet professional, no buzzwords").

Iterative refinement:

Never publish first-draft AI copy. Edit for human authenticity, factual accuracy, and brand alignment.

Hour 2: Easy practice — multi-tool copy test

Product: "EcoSip — reusable smart water bottle that tracks daily hydration."

Target audience: busy office professionals.

Tasks:

1. Use an AI tool to generate 3 catchy social media headlines.
2. Draft a 50-word promotional post with a clear CTA.
3. Evaluate tone, clarity, and persuasiveness.
4. Refine the output with one follow-up constraint prompt.

Easy AI prompt:

“Act as a direct-response copywriter. Write a 50-word Instagram caption promoting a smart water bottle for office workers. Include an engaging hook, benefits, and a CTA. Keep the tone vibrant and concise.”

Theory: marketing data fundamentals

• Modern marketing relies on gathering structured and unstructured customer data across touchpoints.

• **Data types:**

- Structured data: numerical metrics, transaction tables, dates, CRM forms.

- Unstructured data: customer reviews, social comments, audio recordings, email text.

• Data collection touchpoints: website cookies, landing page forms, email clicks, point-of-sale systems, customer feedback surveys.

Data management & hygiene:

• Cleaning: removing duplicate leads, correcting invalid email formats, standardizing country codes.

• Categorization: tagging customer feedback by sentiment and product feature.

• Data privacy & compliance: adhering to consent rules (GDPR, cookie consent) and safeguarding customer contact lists.

AI capability in data management:

AI excels at transforming messy, unstructured customer text into clean, structured tables ready for analysis.

Hour 3: Easy practice — customer data structuring

Raw unstructured customer feedback:

1. "Loved the water bottle design, but shipping took 10 days! (Rating: 3/5)"
2. "Customer support was super helpful when my lid broke. (Rating: 5/5)"
3. "Way too expensive for the quality, will not buy again. (Rating: 1/5)"

Tasks:

1. Convert these three reviews into a structured table with columns: Customer ID, Category, Sentiment (Pos/Neg/Neutral), Rating, and Action Required.

Easy AI prompt:

“Convert these 3 customer reviews into a clean Markdown table with columns: Review ID, Topic, Sentiment, Star Rating, and Recommended Business Action.”

Hour 4: Data analysis techniques for business

Theory:

• Data analysis translates raw data into actionable business intelligence.

• **Key analytical techniques:**

- Sentiment analysis: classifying customer emotion (positive, negative, frustrated, satisfied).

- Trend analysis: tracking metric movements over weeks, months, or quarters.

- Churn analysis: identifying behaviors that precede customer cancellations.

- Cohort analysis: comparing performance across different customer acquisition groups.

The 4-stage business analysis cycle:

1. Ask: What specific business question needs answering?
2. Inspect: What patterns or anomalies emerge from the data?
3. Synthesize: What is the underlying cause of the pattern?
4. Recommend: What concrete marketing action should follow?

Critical concept: analysis must always tie back to business impact (revenue, retention, or customer satisfaction).

Hour 4: Easy practice — review sentiment & insights

Dataset summary (100 customer complaints):

- 60 complaints: App synchronization failed after update.
- 25 complaints: Delayed delivery time.
- 15 complaints: Difficult return policy.

Tasks:

1. Calculate the percentage share for each complaint category.
2. Identify the #1 priority issue for management.
3. Formulate one immediate business decision.

Easy AI prompt:

“Analyze this customer complaint breakdown: 60 app sync errors, 25 late deliveries, 15 return issues. List the primary operational risk and draft an executive action plan in 3 bullet points.”

Hour 5: Business intelligence tools for marketing

Theory: marketing Business Intelligence (BI)

• Marketing BI aggregates data from ads, social media, websites, and sales to track performance against goals.

• **Essential marketing KPIs:**

- CAC (Customer Acquisition Cost) = Total Ad Spend / Customers Acquired.

- ROAS (Return on Ad Spend) = Revenue from Ads / Ad Spend.

- CTR (Click-Through Rate) = Clicks / Impressions × 100.

- LTV (Customer Lifetime Value) = Average Purchase Value × Purchase Frequency × Customer Lifespan.

Dashboard design principles for marketing:

• Keep top-level KPIs visible at a glance (Spend, Revenue, ROAS, Leads).

• Enable channel comparison (Facebook vs. Google vs. Email).

• Use color indicators: Green (exceeding target), Yellow (warning), Red (action required).

BI tools ecosystem: Google Looker Studio, Microsoft Power BI, Tableau, and embedded AI dashboard analytics.

Hour 5: Easy practice — marketing KPI calculation

Marketing campaign metrics:

- Total Ad Spend: $2,000
- Total Impressions: 100,000 | Total Clicks: 4,000
- Customers Acquired: 50 | Revenue Generated: $6,000

Tasks:

1. Calculate CTR (Click-Through Rate).
2. Calculate CAC (Customer Acquisition Cost).
3. Calculate ROAS (Return on Ad Spend).
4. State whether the campaign is profitable.

Easy AI prompt:

“Given Ad Spend $2,000, Impressions 100k, Clicks 4k, Customers 50, and Revenue $6,000, calculate CTR, CAC, and ROAS. Provide an executive summary of campaign health in 2 sentences.”

Hour 6: Understanding machine learning for business

Theory: machine learning (ML) fundamentals

• Machine Learning is the science of training algorithms to recognize patterns in historical data and make predictions without explicit rules.

• **Core ML approaches in business:**

- Supervised learning: trained on labeled data (e.g., predicting if a lead will buy based on past buyer profiles).

- Unsupervised learning: finds hidden patterns (e.g., customer clustering and segmentation).

- Reinforcement learning: optimizes actions via reward loops (e.g., dynamic ad bidding algorithms).

High-impact business ML use cases:

• Predictive lead scoring: ranking inbound leads from most to least likely to convert.

• Product recommendation engines: "Customers who bought this also bought..."

• Dynamic pricing: adjusting prices based on demand and inventory.

Day 20 recap & key takeaways:

• AI accelerates content creation and market research.

• Clean data management is the foundation of effective BI and ML.

• Business value is unlocked when AI insights drive measurable commercial actions.

Hour 6: Easy practice — lead scoring & wrap-up

Lead scoring scenario:

Score three leads from 0 to 100 based on likelihood to buy:

- Lead 1: Visited pricing page 5 times, downloaded product brochure, company size 50+.
- Lead 2: Visited blog once, unsubscribed from newsletter.
- Lead 3: Attended live product webinar, asked 2 questions.

Tasks: Rank the leads and assign sales team priority (High / Medium / Low).

Exit ticket (5 minutes):

1. Name one Generative AI tool and one BI metric used today.
2. Explain the difference between structured and unstructured data.
3. How does machine learning help sales teams prioritize leads?
